Is There an Association With Periodontitis and Obstructive Sleep Apnea? A Systematic Review

Vanessa Rocha Rodrigues DDS, MSc¹, Susana Falardo Ramos, DDS, MSc, PhD²

¹Postgraduate in Periodontology and Implants - Faculty of Dental Medicine, University of Lisbon, Specialist in Periodontology by the Portuguese Dental Association, PhD Student in Periodontology - Faculty of Dental Medicine, University of Lisbon, Assistant Professor, Department of Periodontology – Faculty of Dental Medicine, University of Lisbon; ²Invited Assistant Professor of Orthodontics, Universidade Católica Portuguesa, Faculty of Dental Medicine, Centre for Interdisciplinary Research in Health, Viseu, Portugal. Board Diplomate by European Academy of Dental Sleep Medicine, International Certificant by American Board of Dental Sleep Medicine, Scientific Committee Member American Academy of Dental Sleep Medicine, President of the European Academy of Dental Sleep Medicine

Study Objectives: Investigate whether there is an association between periodontitis and obstructive sleep apnea (OSA).

Methods: An electronic search was performed on PubMed, LILACS, and Cochrane Library without any time or language restrictions and it was undertaken until January 31, 2021. The following keywords were used: (“obstructive sleep apnea” and “periodontitis”; “treatment of periodontitis” and “obstructive sleep apnea”). Only studies that used laboratory-based polysomnography to evaluate the OSA were included. For the diagnostic of periodontitis, only studies that used evaluation of pocket depth and clinical attachment loss were included. This review was registered with the identification number CRD42021236096, in the PROSPERO International Prospective Register of Systematic Reviews hosted by the National Institute for Health Research, University of York, Centre for Reviews and Dissemination.

Results: The search strategy resulted in six papers. Only case-control and cross-sectional studies were included. The studies included evaluated the association between periodontitis and OSA and one study assessed the concentrations of a number of salivary cytokines in patients with OSA syndrome and those without OSA syndrome. The reported prevalence of periodontitis ranged between 17.5% and 77% to 96.4% in patients with OSA.

Conclusion: Most of the included studies support the hypothesis that an association exists between periodontitis and OSA; however, more intervention studies are needed.

Clinical Implications: OSA may be a potential risk factor for periodontal disease; however, randomized controlled clinical trials with longer follow-up times are needed.

Keywords: obstructive sleep apnea, periodontitis, periodontal treatment

INTRODUCTION

Periodontitis is a multifactorial infection that results in connective tissue destruction, alveolar bone resorption, and eventually tooth loss.¹ Periodontal disease is one of the most prevalent chronic inflammatory diseases worldwide.

The association between periodontitis and systemic diseases has been studied over several years. The association has been made mainly with diabetes mellitus, cardiovascular diseases, and rheumatoid arthritis. ²

In recent years, there has been growing interest in periodontitis and obstructive sleep apnea (OSA). These two diseases have similar risk factors, such as age, sex, and smoking.⁵ Furthermore, the inflammatory mediators play a role in both diseases. These two conditions are associated with similar systemic inflammatory responses and involve common inflammatory mediators such as interleukin-1B, interleukin-6, tumor necrosis factor-alpha, and C-reactive protein.³

OSA comprises episodes of partial or complete occlusion of the upper airways during sleep and causes cessation of breathing and resulting in hypoxia, hypercapnia, and sleep fragmentation.³

OSA has also been linked to several systemic conditions including, cardiovascular disease, ⁴ stroke, ⁶ endocrine diseases (such as diabetes), and hypertension.⁷

The severity of OSA is based on the apnea–hypopnea index (AHI), which is the total number of apnea and hypopnea episodes that occur during sleep divided by the hours of sleep. It is a summary measure used for sleep-disordered breathing. “In adults, an AHI of less than 5 events per hour is considered normal. Mild OSA is defined as an AHI ≥5 to 15 events per hour, moderate OSA≥ 15 to 30 events per hour, and severe OSA ≥30 events per hour”.⁸

The purpose of this review is to evaluate the association between periodontal disease and OSA.
MATERIALS AND METHODS

Study Registration

The review was registered with the identification number CRD42021236096, in the PROSPERO International Prospective Register of Systematic Reviews hosted by the National Institute for Health Research, University of York, Centre for Reviews and Dissemination.

Research and Study Selection

An electronic search without time or language restrictions was undertaken between January 31, 2021 in the following database: PubMed, LILACS, and Cochrane Library using the following keywords and MeSH terms: (“Obstructive Sleep Apnea” and Periodontitis”; and “Treatment of Periodontitis”).

Design of the Included Studies, Eligibility Criteria and Patient, Intervention, Comparison, Outcome (PICO) Question

The methodology used to perform this study was based on the study published by Al-Jewair et al. However, in this systematic review only cross-sectional and case-control studies were included, and for the diagnostic of OSA only articles that used polysomnography were included. For the diagnostic of periodontitis, only the studies that included evaluation of probing pocket depth and clinical attachment level were included.

This systematic review utilized the meta-analyses of observational studies in epidemiology (MOOSE) guidelines statement and checklist.

Risk of Bias in Individuals and Across Studies

For the assessment of nonrandomized studies and the risk of bias, the Newcastle-Ottawa Scale (NOS) was used by the authors of this study.

The Newcastle-Ottawa Scale (NOS) assesses the quality of nonrandomized studies included in a systematic review and/or meta-analyses and evaluates three elements. A score ranging from 0 to 9 was allocated to each study, and those with a score of 6 or higher were considered to be high-quality studies.

For the three case-control studies, two of them were categorized with low risk of bias (scored 8-9). One study was categorized at medium risk of bias. For the three cross-sectional studies, two of them were categorized with high risk of bias (scored ≤5). The third study was categorized as having low risk of bias (scored 8-9).

RESULTS

Literature Search

The study selection process is summarized in Figure 1. An electronic search was performed on PubMed, LILACS, and Cochrane Library without any time or language restrictions and it was undertaken until January 31, 2021. Records were also identified through other sources (such as professional organization websites, cited references) using the following keywords: (“obstructive sleep apnea” and “periodontitis”; “treatment of periodontitis” and “obstructive sleep apnea”). Only studies that used laboratory-based polysomnography to evaluate the OSA were included. For the diagnostic of periodontitis, only studies that used evaluation of pocket depth and clinical attachment loss were included. The search strategy resulted in six papers. All data were extracted by the study authors, independently and in duplicate operating with data extraction forms.

All the data collected were loaded to Review Manager software and checked. The following factors were noted:

a. Type of study, year of publication, population, age, and sex that were included
b. Diagnostic of periodontitis and OSA
c. Results
d. Risk of bias

After reading the title or abstract, 96 articles were excluded (interreader agreement $\kappa = 0.944 \pm 0.056$ for kappa calculation) and the following site was used https://www.graphpad.com/quickcalcs/kappa1.cfm. Any disagreement was resolved by discussion.

All of the authors of the included studies were contacted and asked if they have more information or unpublished material. None of the authors have replied.

Articles between selected records and full-text articles were excluded by study title and abstract, because they do not meet the objectives of the systematic review and they were not control or cohort studies.

The full-text reports of the remaining 10 articles led to the exclusion of 4 because they did not meet the inclusion criteria. The diagnostic for OSA were self-reported using the Berlin questionnaire (Bq), the Epworth Sleepiness Scale (ESS), and the STOP-Bang questionnaire and were applied to determine the risk for OSA syndrome. The study was excluded because 1 year later the author published a similar article.

Study Design and Follow-Up

Of the selected studies, all were cross-sectional and case-control studies.
DISCUSSION

The aim of this review was to investigate the association between periodontal disease and OSA.

Five of the six studies 2, 8, 9, 11, 12 evaluated the association between periodontal disease and OSA, and one study 10 assessed the concentrations of a number of salivary cytokines in patients with OSA syndrome and those without OSA syndrome (Table 1).

The reported prevalence of periodontitis ranged between 17.5 and 77% to 96.4% in patients with OSA 2, 8, 9, 11, 12.

Gunaratnam et al., 12 reported a 77% prevalence of periodontitis in patients with OSA. The prevalence of periodontitis in a group of patients with OSA is greater than the national average.

Also, in three studies, 9, 11, 12 the prevalence of periodontitis was higher in the OSA group (96.4%) than in the control group (75%) (P <0.001).

Five studies found a significant relationship between periodontitis and OSA. 2, 8, 9, 11, 12. On the contrary, one cross-sectional study 8 failed to show significant differences in the clinical attachment level between the OSA groups.

The study by Seo et al., 11 revealed that there is a significant association between OSA and periodontitis. The authors state that OSA may be a risk factor for periodontitis and the treatment can prevent the progression of periodontitis. They concluded that periodontitis was more frequent in patients with OAS than in individuals without OAS (17.5%).

Another study, 9 after adjusting for socioeconomic factors, concluded that patients with OSA were 1.75 times more likely (95% CI = 1.67–1.88; P <0.001) than control patients to have periodontitis. (33.8% versus 22.6%, P <0.001).

Furthermore, all the clinical periodontal parameters, including index of plaque and gingival index, bleeding on probing, probing pocket depth, and clinical attachment loss, were significantly higher in the OSA group than in the control group. 9, 11, 12

Conversely, another study evaluating the association between periodontal disease severity and OSA severity found no association between OSA and periodontitis. 9 The only parameter with a significant association was the plaque index. 8

Other studies were able to detect greater numbers of periodontally relevant pathogenic microorganisms in patients with the most severe OSA. 10 The differences in microbial ecology, which might influence onset and/or progression of periodontitis, may be explained by a low-grade inflammation associated with OSA together with intermittent decrease in oxygenation. The drying of the oral cavity may also prevent self-cleaning ability of the oral mucosa and result in increased bacterial colonization. 16, 17

The findings in this systematic review need to be interpreted with caution because the quality of the evidence was low in many studies. The assessment of periodontal disease and definitions used differed among the studies, which may have resulted in overestimation or underestimation of the disease prevalence. Also, the AHI index for OSA ascertainment varied among the studies. More randomized controlled clinical trials with longer follow-up times are needed to provide clear recommendations on this association.

CONCLUSIONS

There is insufficient evidence on the association of periodontal disease and OSA. Most of the included studies support the hypothesis that an association exists between periodontitis and OSA; however, more intervention studies are needed to confirm a cause-effect relationship between periodontitis and OSA.
